# BioVis in support of Neuro research

2. 19. 18

Guest Lecture: Ross Lagoy | [rosslagoy@wpi.edu](mailto:rosslagoy@wpi.edu)

Albrecht Lab | WPI Biomedical Engineering Department

# Dirk Albrecht's 'Quantitative NeuroTechnology' Lab (QNTL)

1. Functional screens for modulators of neural dynamics
2. Light sheet microscopy for long-term multi-neuronal imaging with chemical and optogenetic stimulation
3. Neural signaling changes across physiological and behavioral states

# Outline: with a focus on data generation and methods for visualization

- Biological significance
  - Why? Where do the numbers come from?
- Format(ing) of the generated data
  - What is the recorded data structure?
- Method(s) to visualize these important numbers
  - What types of plots, colors, sizes, etc.
  - What numbers are most important?
  - What do the results tell us?
  - Can the data be interactive?

# The human brain is complicated

Billions of neurons  
Trillions of synapses (connections between neurons)  
Control of our thoughts and behavior  
Affected by disease  
It's a chemical-electrical system...

Change in fluorescence correlates to increase in calcium ion concentration

$$\uparrow \Delta F \propto \uparrow \text{Ca}^{2+} \propto \text{cellular activity}$$

Schrödel, T.+ (2013). *Nature Methods*  
*C. elegans*

# Calcium is important!

- Calcium mediates cellular activity through biological pathways
- Regulates gene expression
- Cell-cell interaction (neurotransmitter release, synaptic communication)
- Contraction in muscle cells (i.e. heart and skeletal)
- Provides a potential difference across cell membranes
- Transported through the blood stream
- Any imbalances (over/under active) can result in disease
  - Autism, epilepsy, schizophrenia, neurodegeneration (by cell death), cardiac arrhythmia, *etc.*

We can record neural activity, but how can we easily stimulate these cells?

# Experimental recap

Flow 57 different compounds past the animals while stimulating and recording with light.

Most chemical libraries are stored in solvents such as DMSO for solubility and chemical stability, yet some show acute suppressive effects on neurons, while chronic exposure can lead to abnormal organism development.

Therefore, assessment of solvent effects is important before screening commercial small-molecule libraries.

Top view  
57 wells  
14 solvents  
2 concentrations

# Looking at all of the neural response traces...

**One animal, one exposure**

Light stimulus

Frame number (10 fps)

**All 20 animals, all 57 exposures**

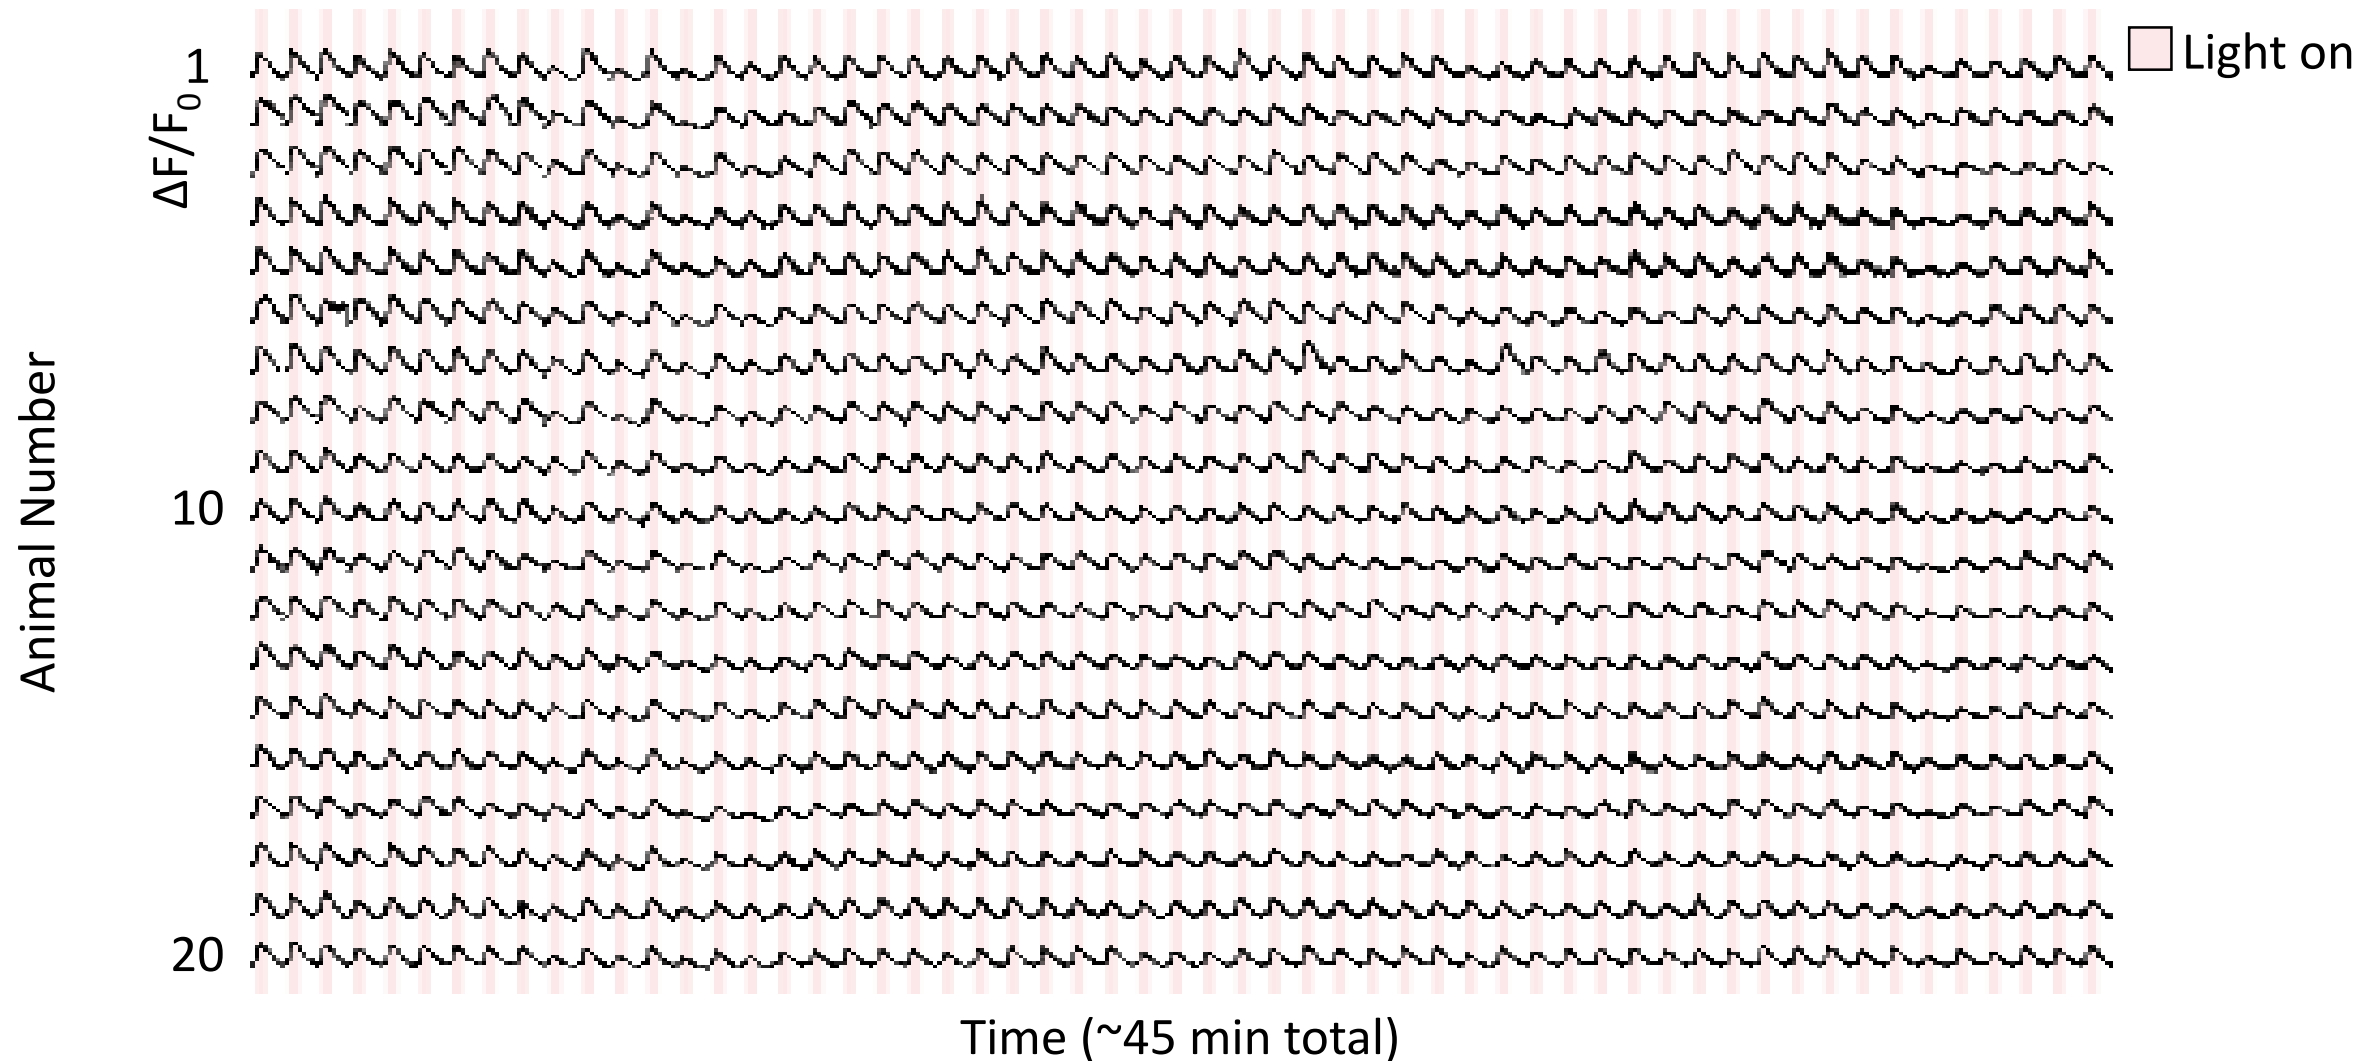

Frame number (10 fps)

# Separating and arranging the data into a matrix

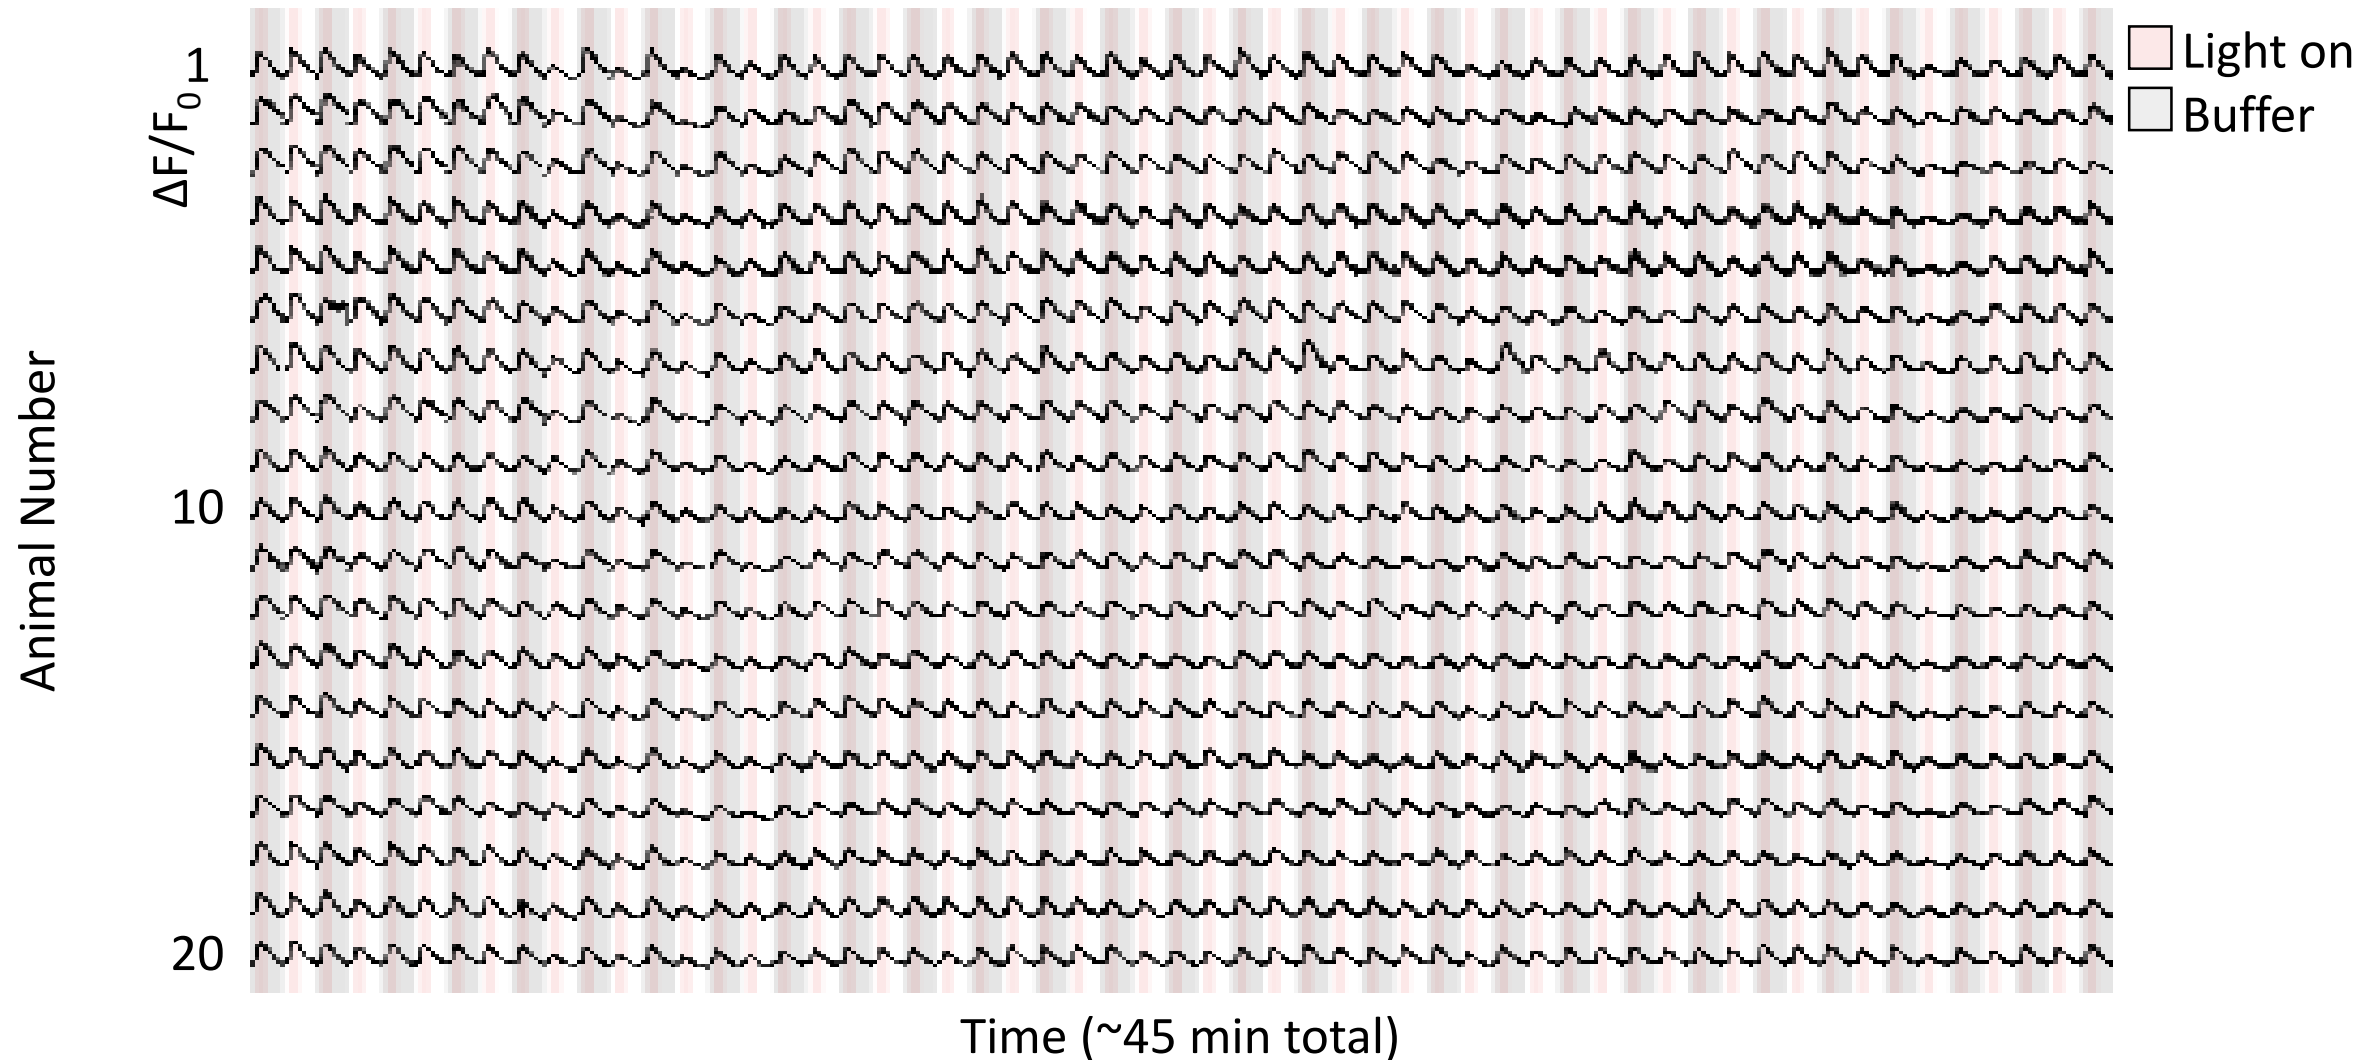

# Separating and arranging the data into a matrix *with stimuli bars*

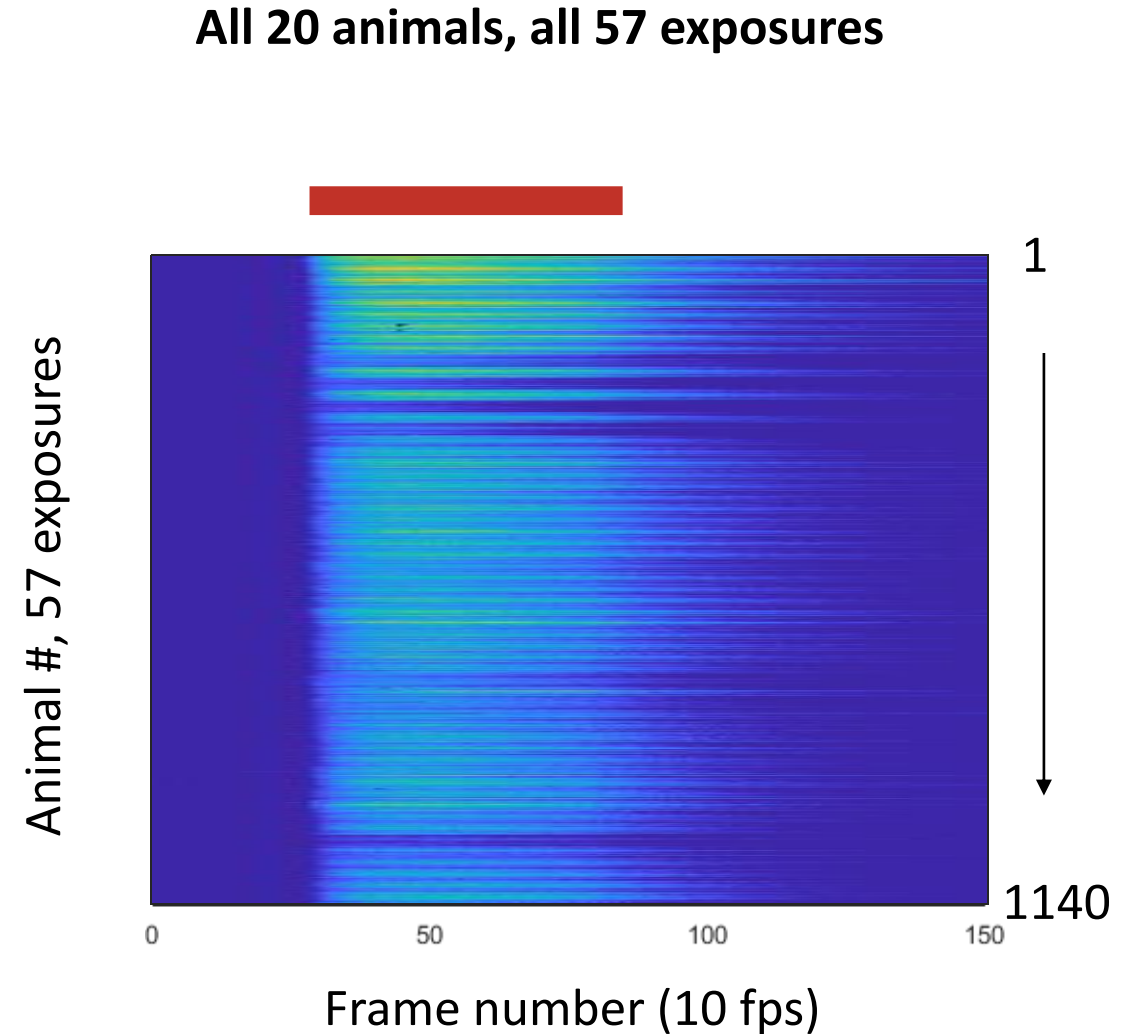

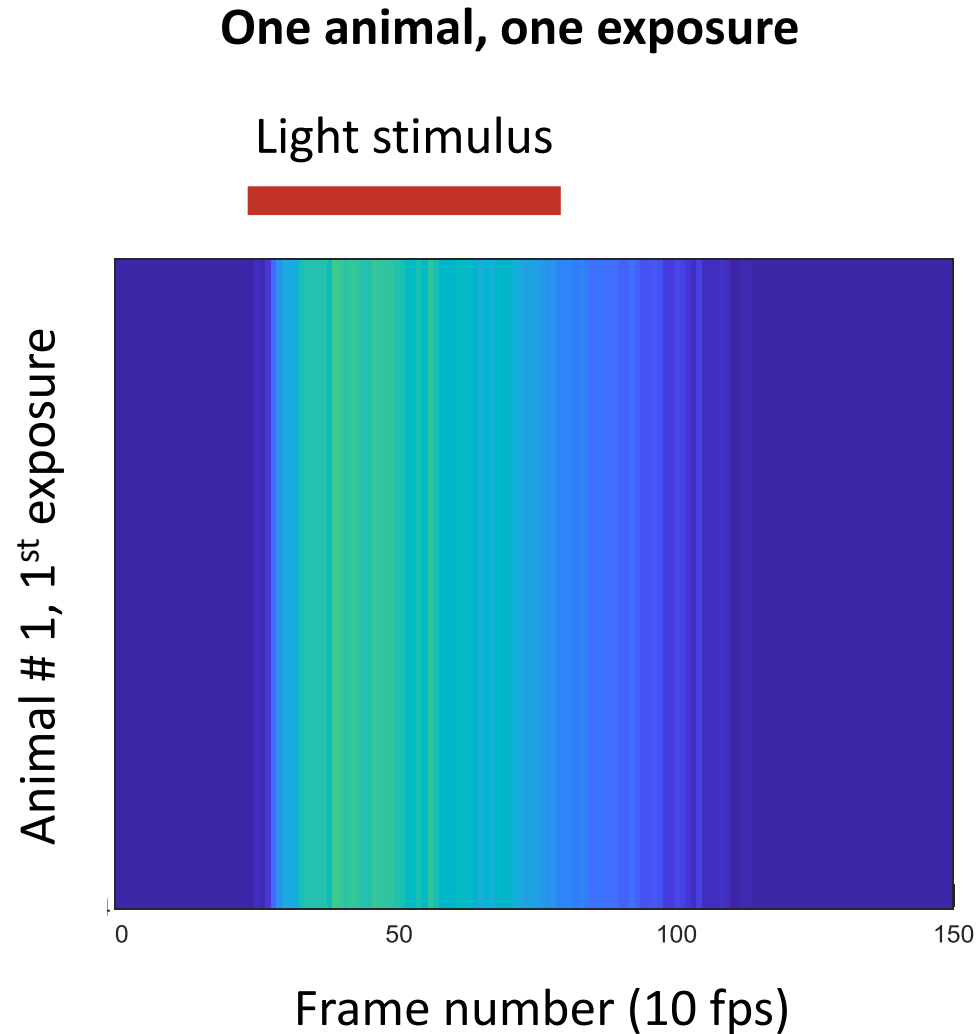

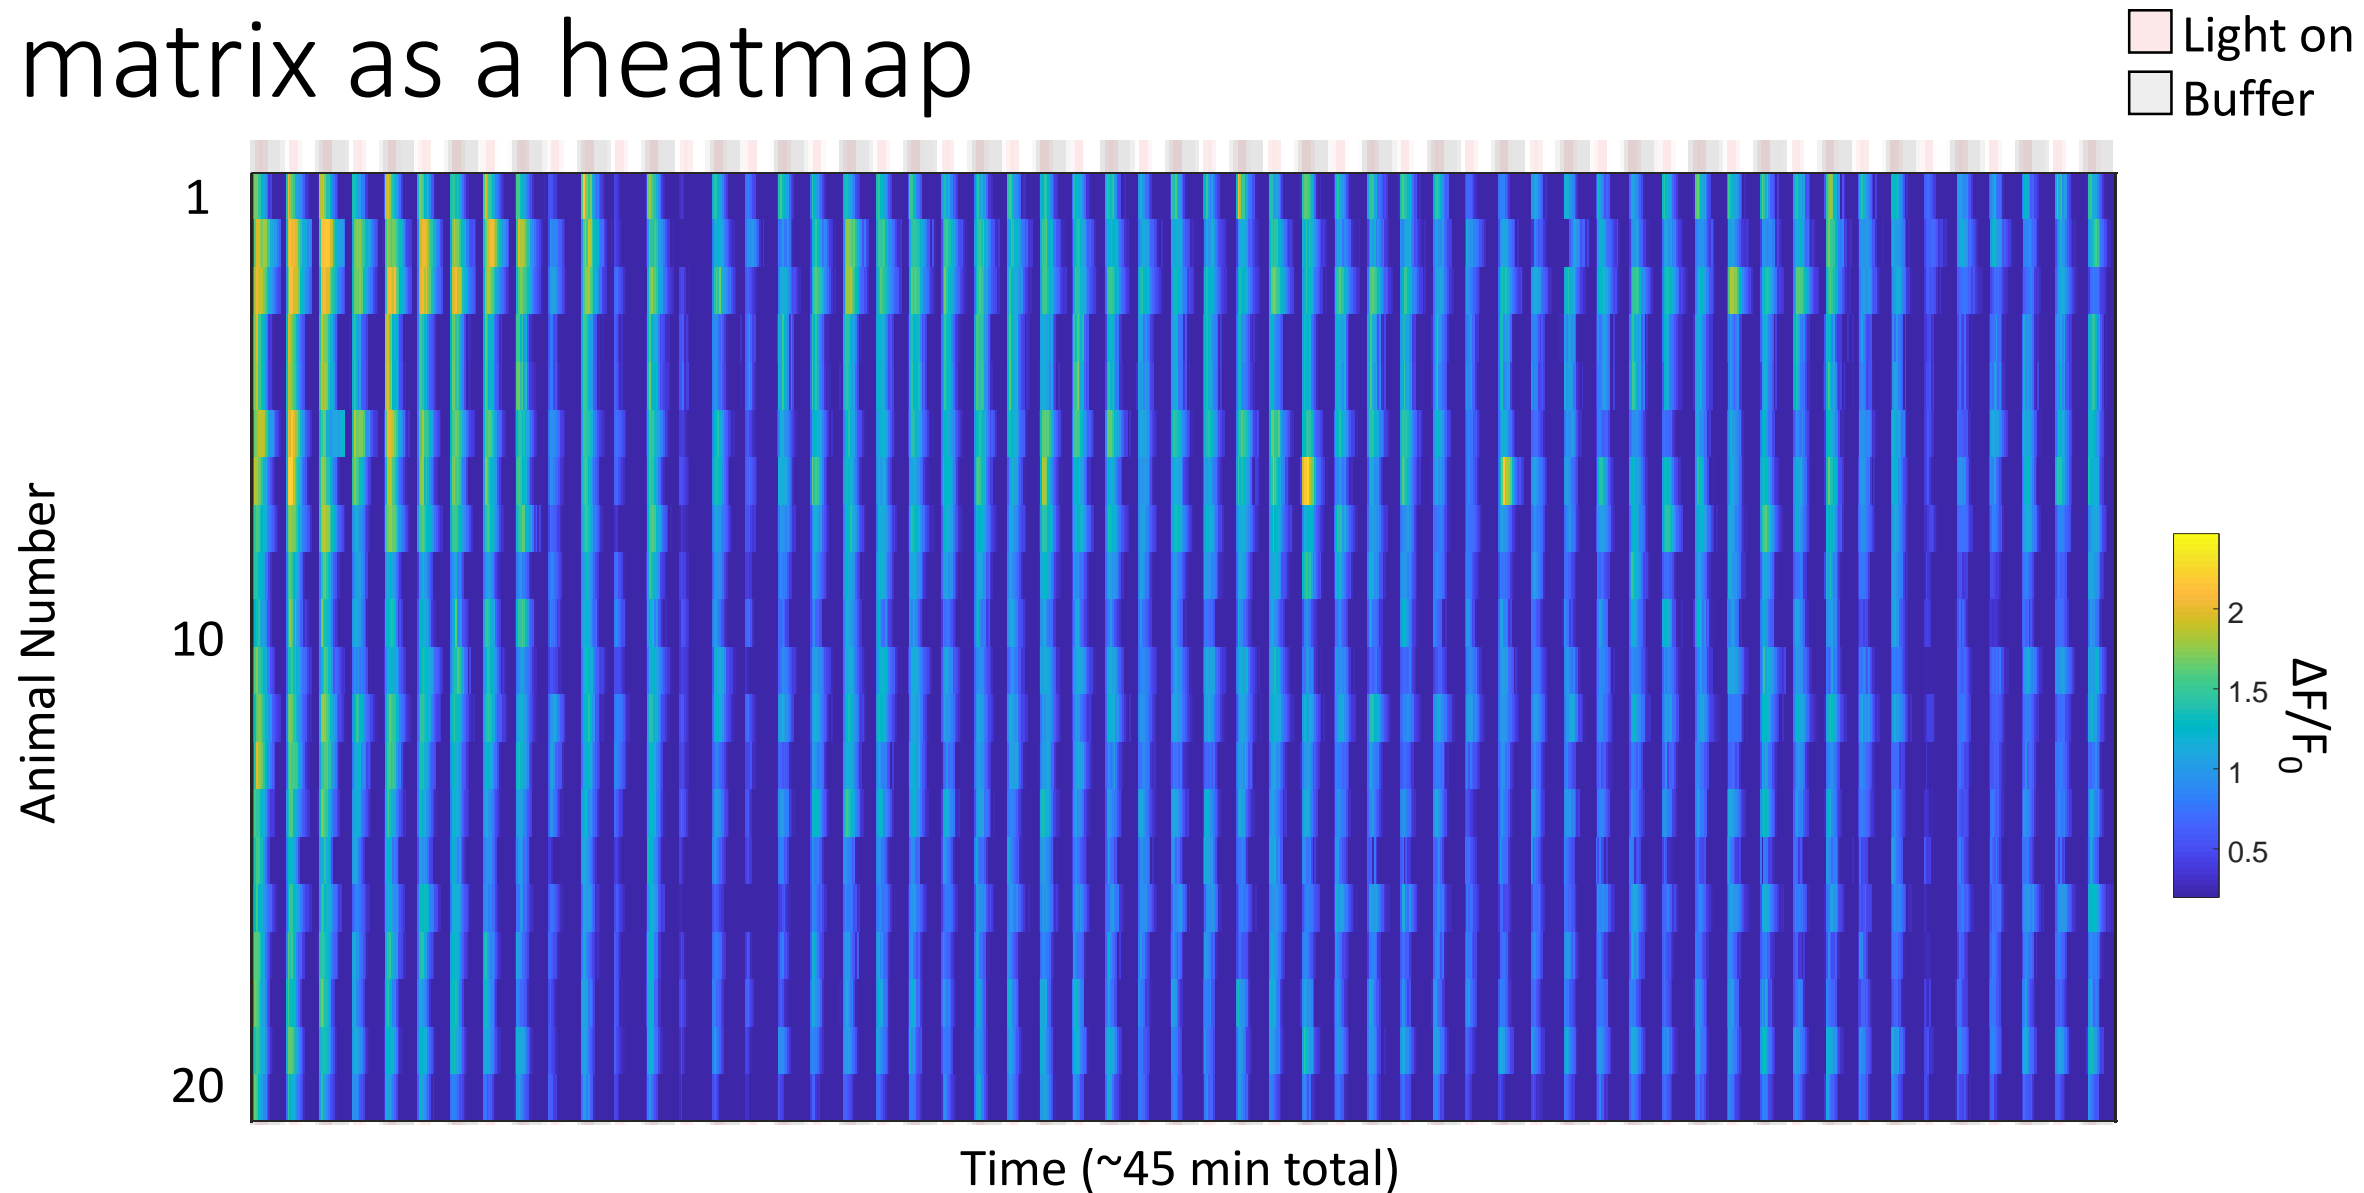

Separating and arranging the data into a matrix *with stimuli bars and buffer wells*

# Looking at all of the neural response traces... Do heatmaps help?

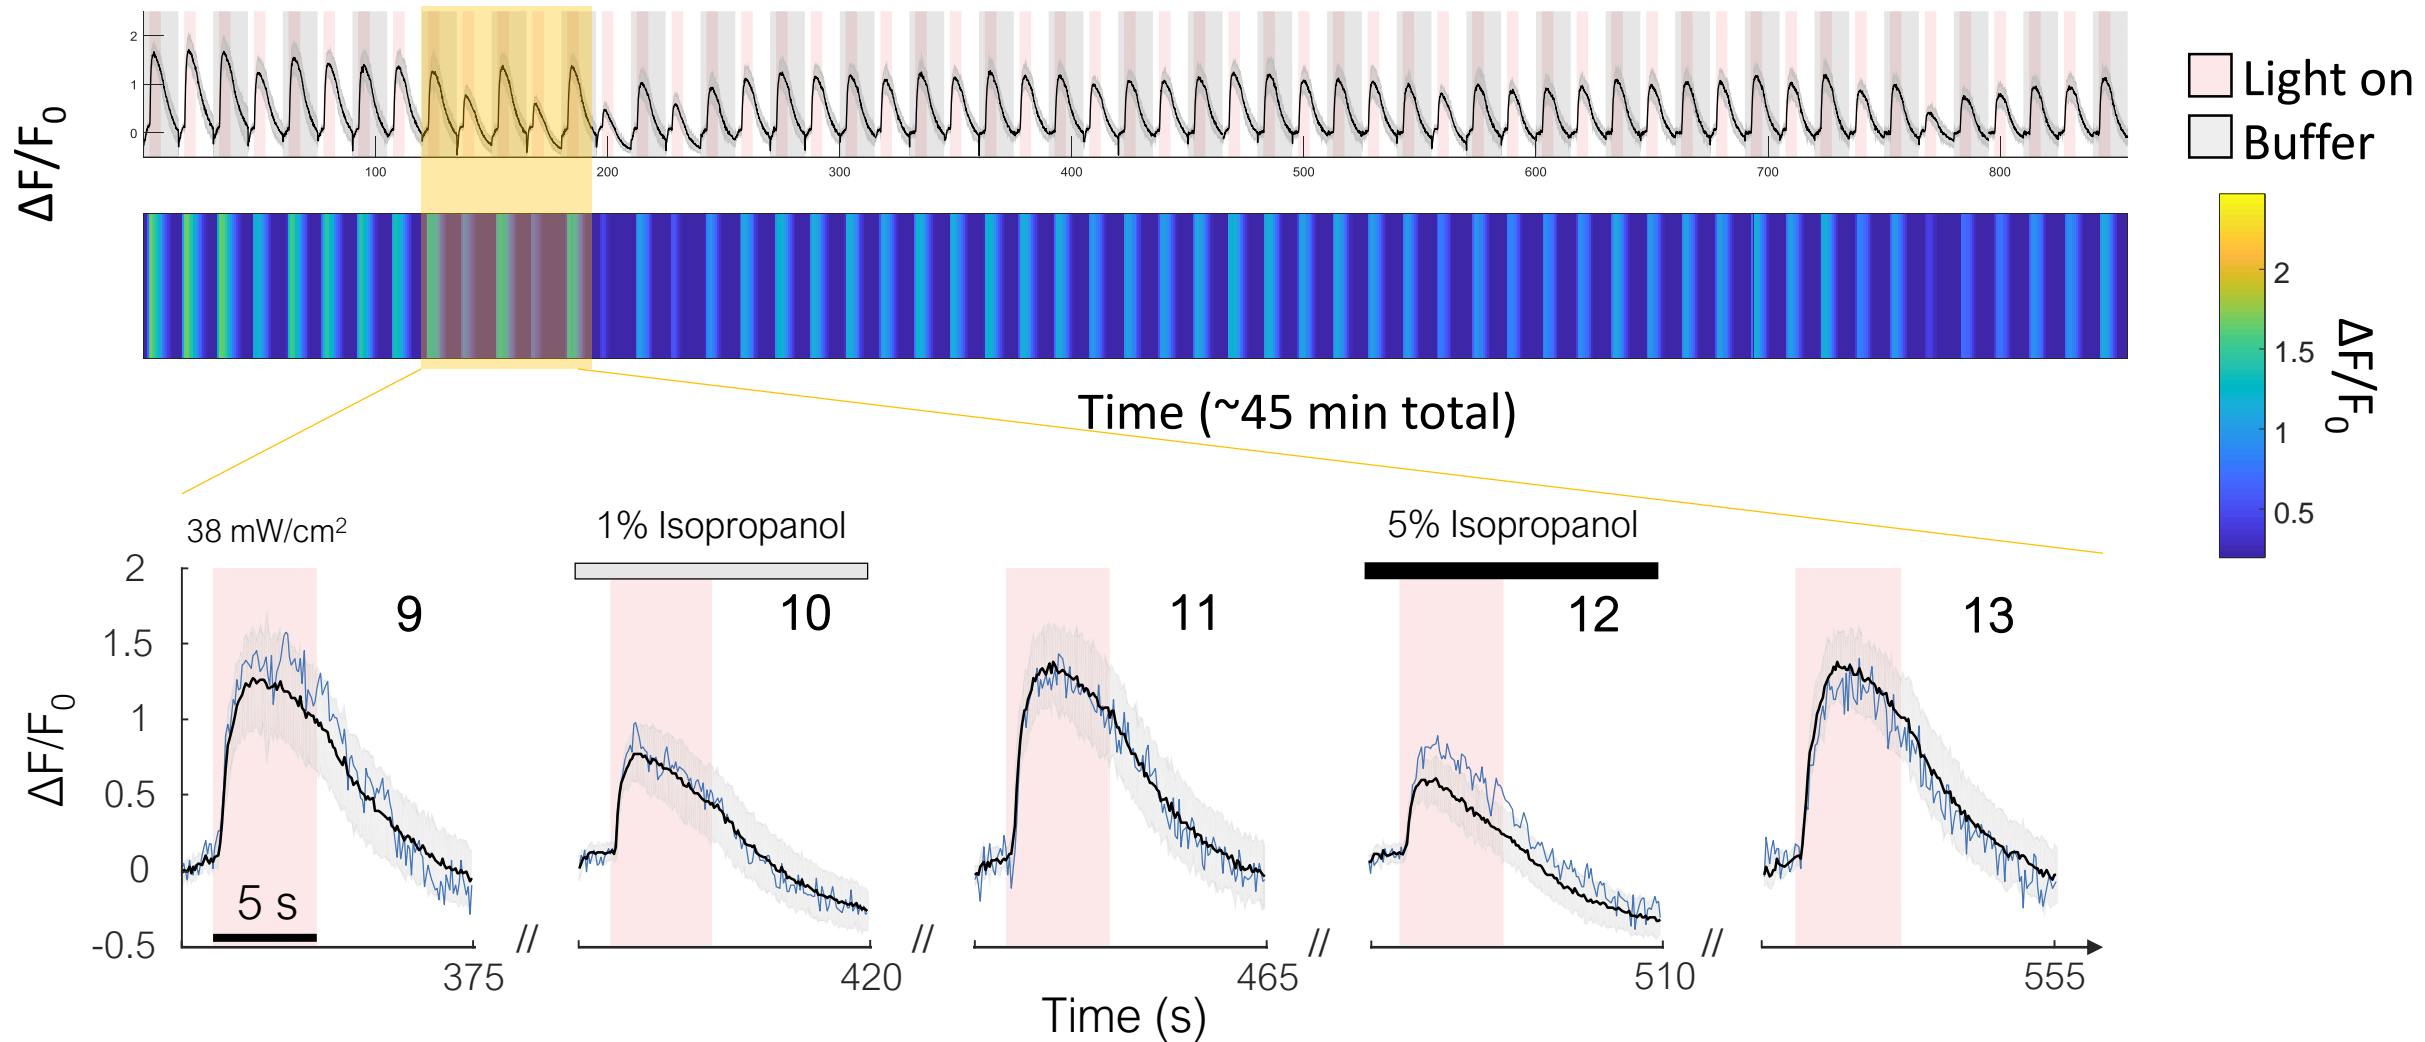

# Separating and arranging the data into a matrix as a heatmap

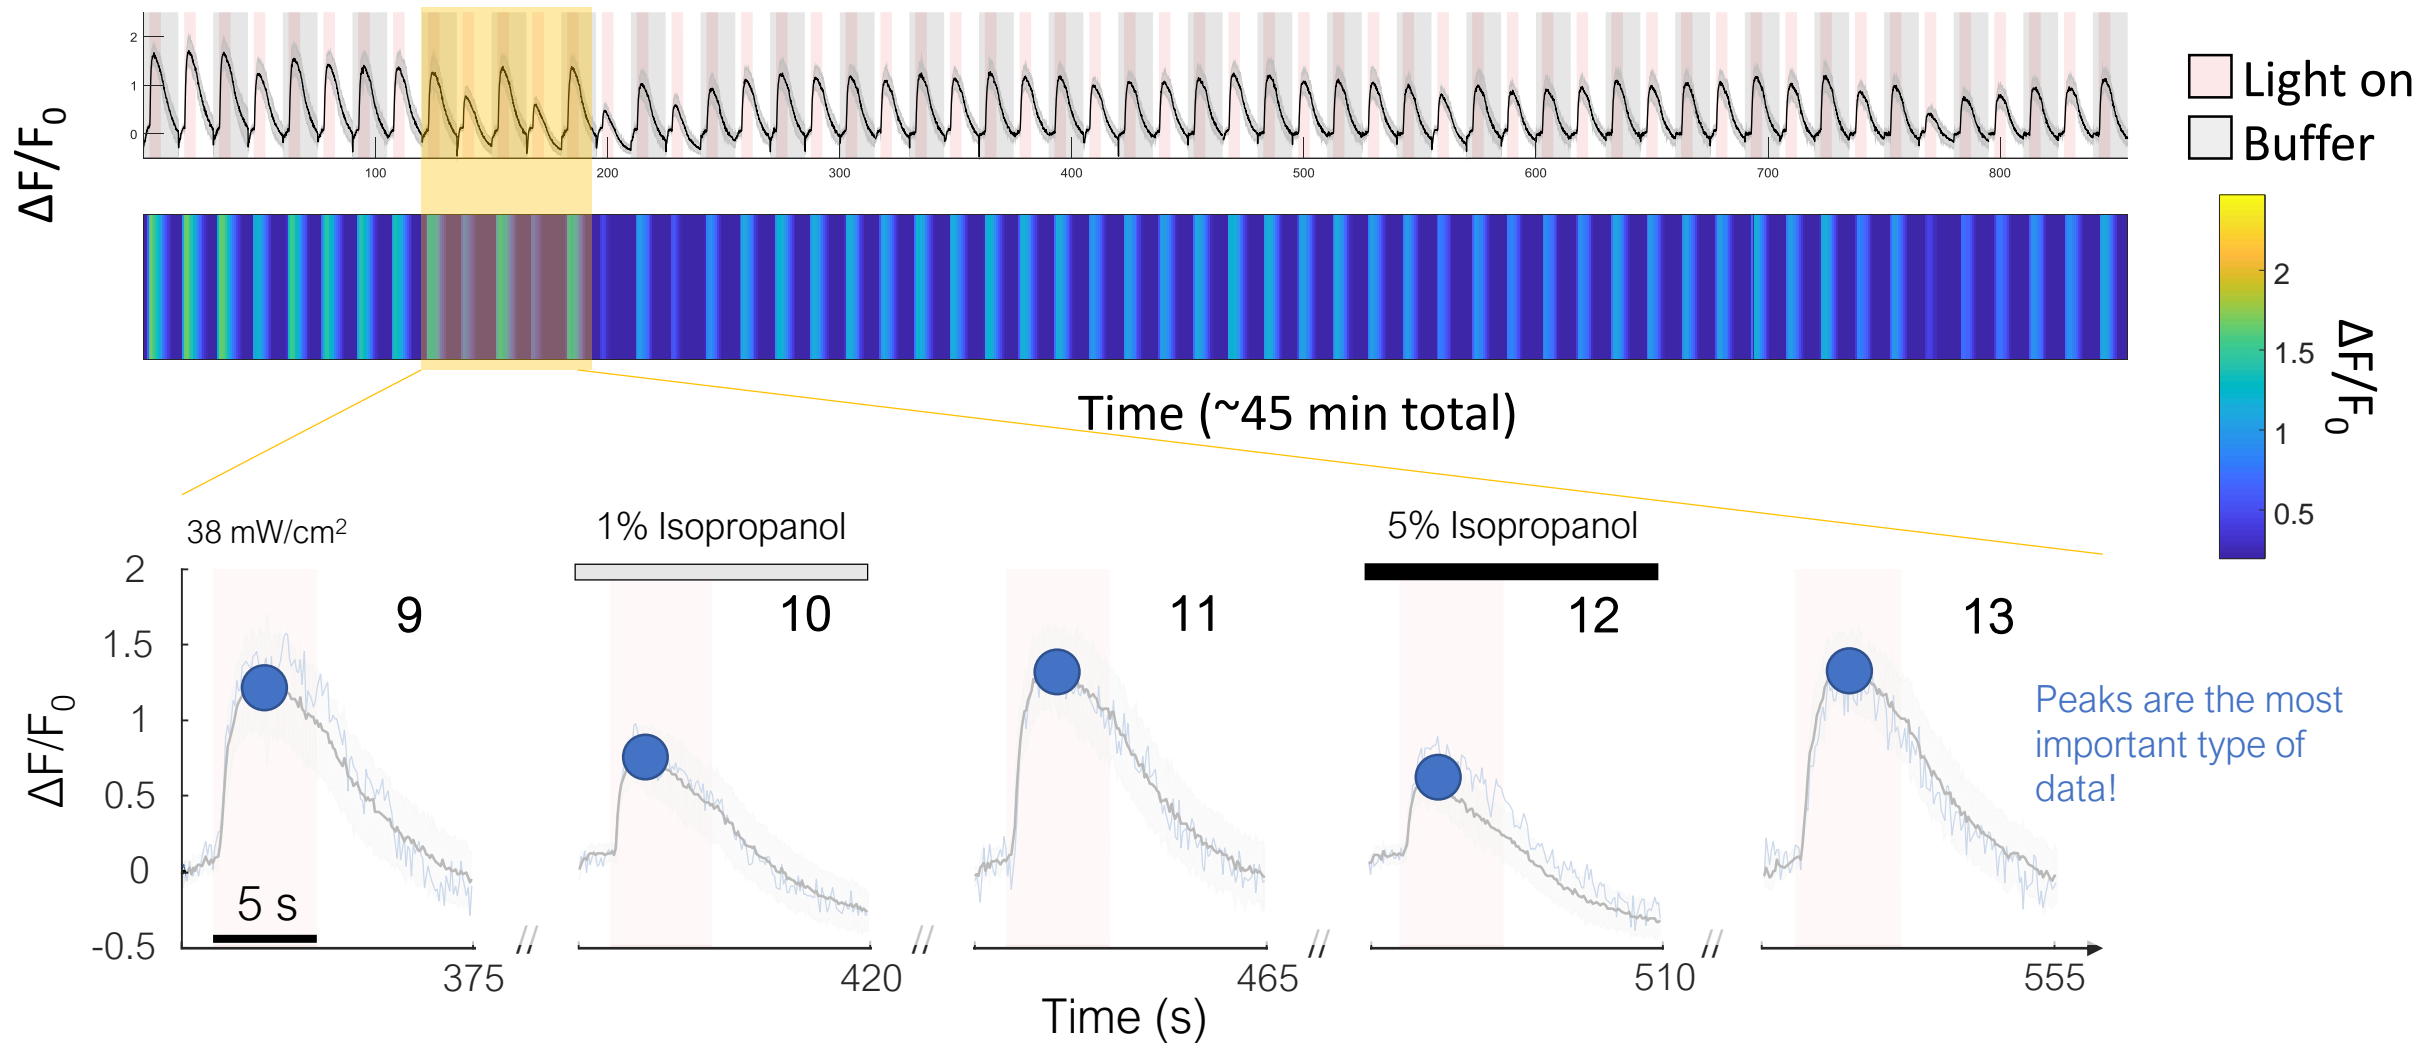

# Averaging all 20 animals across all 57 exposures as a trace and heatmap

# Averaging all 20 animals across all 57 exposures

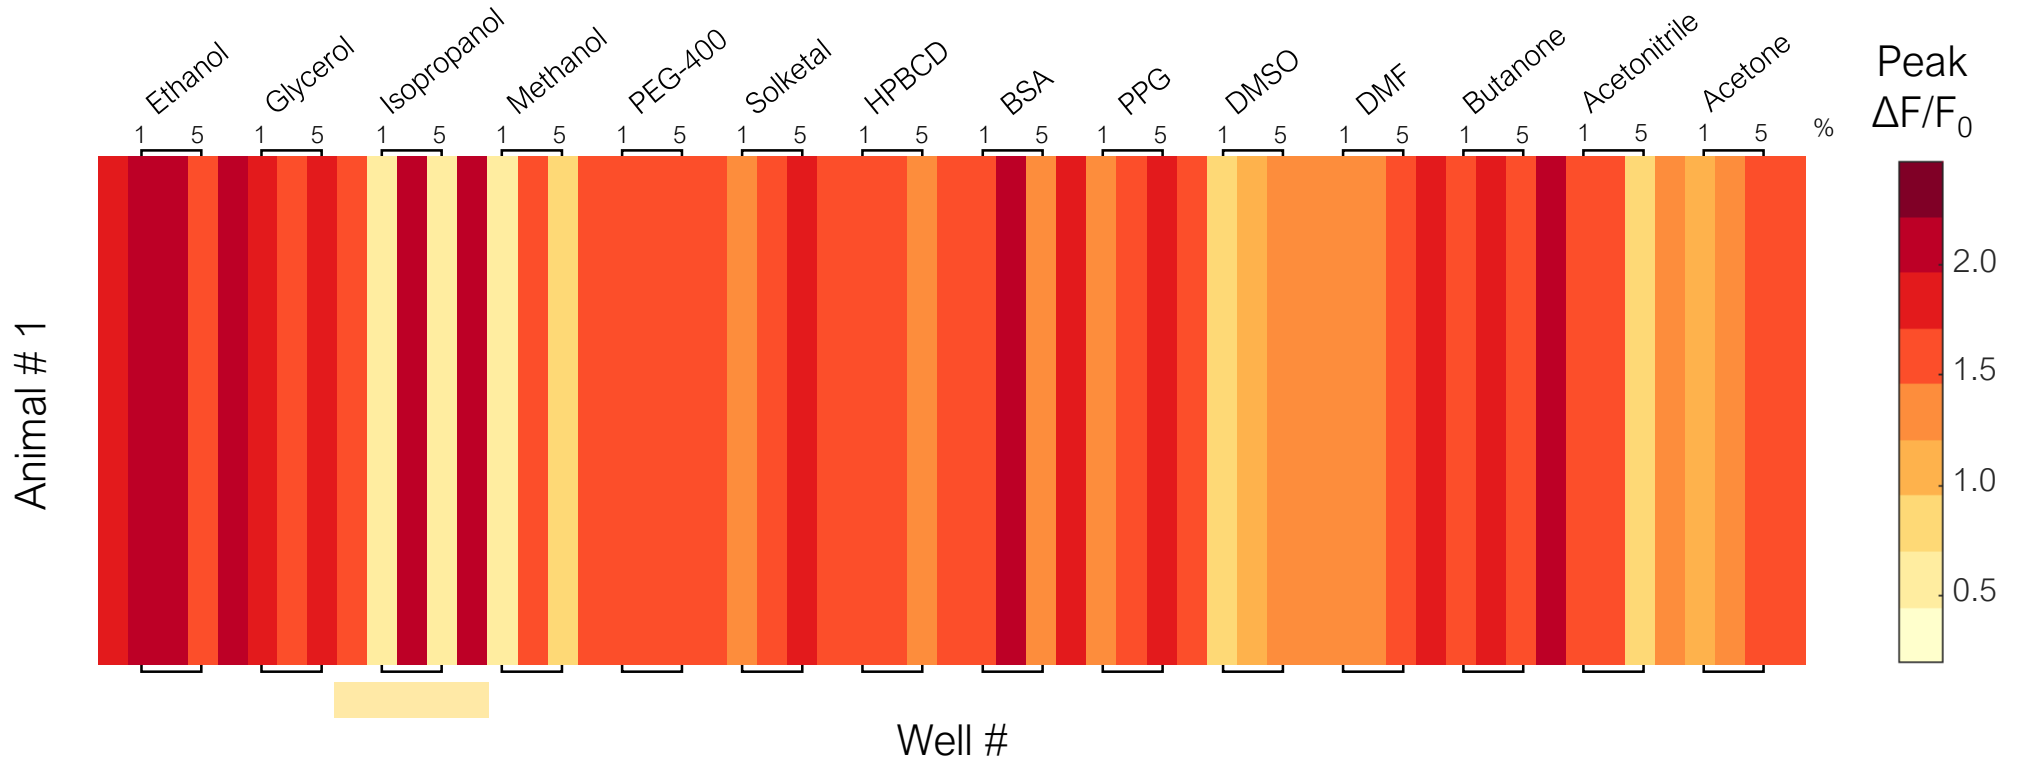

# Averaging all 20 animals across all 57 exposures

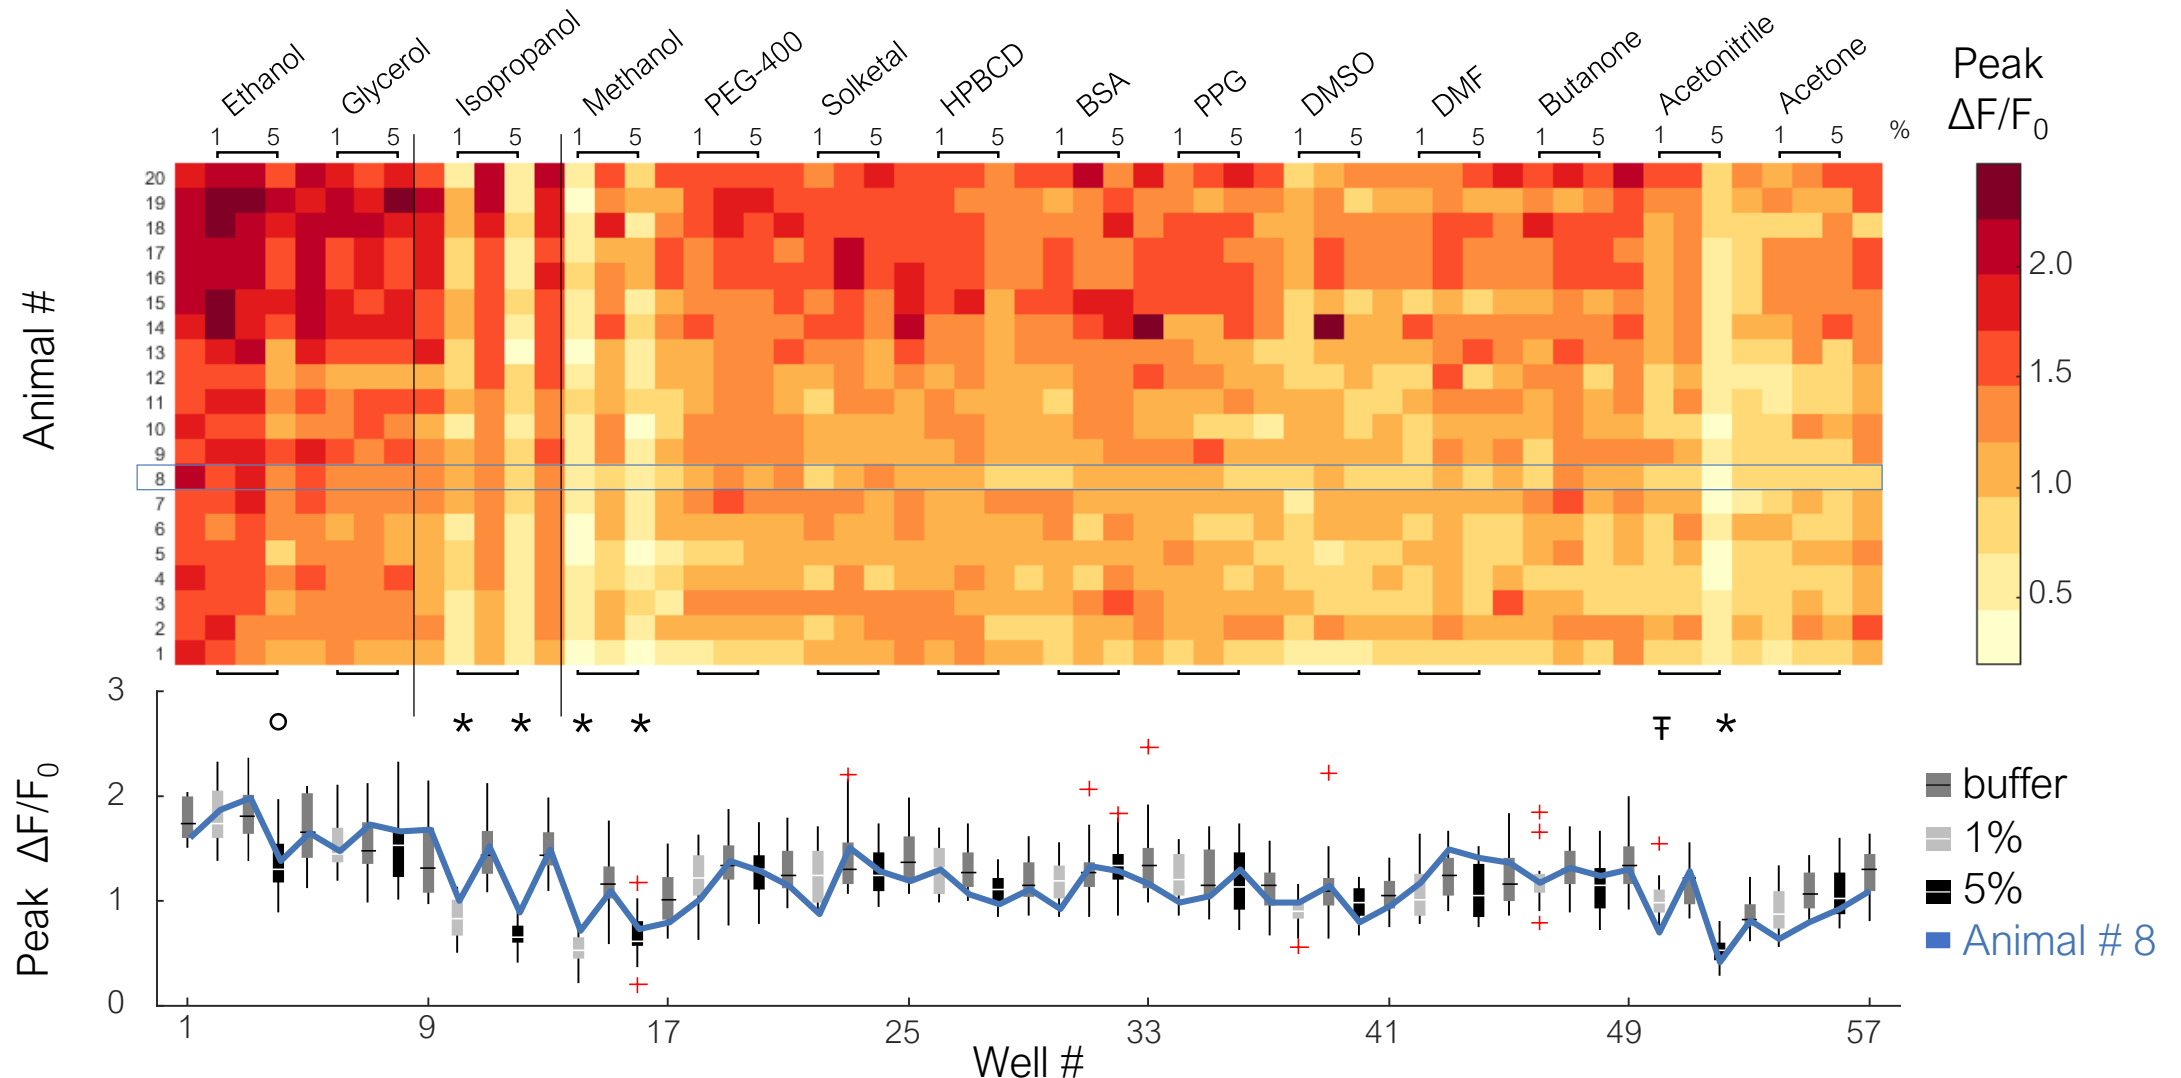

A heatmap of peak neural responses from 1 animal traces and all 57 exposures

A heatmap, boxplot, and individual animal from all 1140 peak neural responses

# Using d3js to visualize and interact with the data...

<http://users.wpi.edu/~rosslagoy/hmv.html>

# What is the biological significance of this result?

- In our assay, even brief, <1 min exposures of 1% and 5% methanol, isopropanol, and acetonitrile suppressed optogenetically-activated neural activity, as did 5% ethanol.
- Since activation and neural response were in the same neurons, the observed response suppression reflects intracellular interference by these solvents.
- Although acute solvent effects were transient, these results strongly suggest that careful selection of solvents is prudent when preparing and selecting drug screen libraries for neural effects.

Are there other ways to visualize this data?

# Thanks for your attention!

Any questions?
